ATHARVA P

Portfolio: https://kaabilengineer.github.io/portfolio | **Project Repositories:** https://github.com/kaabilengineer | **Contact:** xxxxxxxxx | **Email:** xxxxxxxxxxx

Professional Summary:

Data & AI Engineer with experience in building scalable ETL pipelines, real-time data processing systems, and data integration solutions across on-prem and cloud (Azure, AWS, GCP) environments. Skilled in designing data models, optimizing big data workflows, and enabling ML/BI use cases through high-quality data engineering practices. Strong background in Python, SQL, Kafka, Spark, and Databricks, with additional expertise in AI/ML, Generative AI, and deep learning, enabling end-to-end data-driven applications. [SHORT 2-3 lines of your Professional Summary]

Work Experience:

1. **Data & AI Engineer | Company Name | Jan 2024 – Present**
   - Created a **vehicle battery data pipeline** handling 20M+ real-time data points, with streaming ingestion, transformation, and storage in **BigQuery**. Implemented downsampling + partitioning strategies, reducing query costs by 40% while supporting a deep learning model for real-time battery health prediction.
   - Built **skill validation AI agents** on top of a real-time **ETL workflow**. Designed three microservices communicating via **Azure Event Hub and Kafka**, ingesting and processing high-volume skill assessment data streams for automated **question generation, response validation, and scoring.**
   - Developed real-time pipelines using **Azure Event Hub + Kafka** to enable **streaming ingestion, transformation, and validation.** Established **event-driven architectures** for asynchronous execution of AI agent workflows.
   - Designed and deployed **TallyTalk, a data pipeline + desktop app** to extract structured data from Tally ERP, APIs, and system

2. **Machine Learning Intern | Company Name | June 2024 – Nov 2024**
   - Processed and analyzed **1.6M+ tweets (10GB raw text)** using **TF-IDF, USE, and BERT** embeddings, achieving **92% classification accuracy** and reducing preprocessing time by **35% with optimized batch pipelines.**
   - Created **100K+ synthetic stock records** based on BSE market trends, ensuring 100% balance constraints and realistic integrity for training ML models.
   - Engineered a Python-based workflow to generate **10K+ CAMT.053 XML files/day** using vectorized operations, cutting runtime from 3 hours to 25 minutes **(85% faster)** for large financial datasets.
   - Implemented detection pipelines **identifying point & collective anomalies** with 97% precision, successfully flagging irregularities in millions of financial transactions.

[Add numbers and Highlight important points in your experience]

Personal Projects:

1. **CVMap.Ai:**
   - Developed a website and added an ML model with 94% accuracy which generates the questions based on the uploaded document.
   - Developed a document-processing pipeline capable of analyzing 50K+ resumes/month, extracting key features, and generating domain-specific interview questions with 94% model accuracy.
   - Implemented a resume generation module that processes user input and generates beginner-friendly AI-enhanced resumes in <5s per document, supporting 1K+ users in testing phase.
   - Development contribution of 100% frontend and 75% backend.
   - **Technology Stack:** Python, Artificial Neural Networks, Flask, Fast API, HTML, CSS, JavaScript, NLP.
   - **URL:** https://github.com/kaabilengineer/CVMap.Ai
2. **Doctor.AI:**
   - Created and launched an AI-powered mobile app featuring a cutting-edge chatbot, enabling users to input health information and receive personalized home remedy and medicine recommendations.
   - Developed a chatbot backend pipeline leveraging NLP and Gemini API to ensure response generation within 2s while maintaining >90% recommendation accuracy.
   - Designed data flow for structured + unstructured health inputs, enabling downstream analytics and insights for preventive healthcare.
   - **Technology Stack:** Flutter, Dart, Gemini API, NLP, Chatterbot.
   - **URL:** https://github.com/kaabilengineer/Chikitsak.Ai

[Add numbers and add your contribution in your team projects, mention tech stack and Repo URL]

Skills:

Programming: Python, SQL, C, C++, Java, HTML, CSS

Data Engineering: Data Warehousing, ETL Pipelines, Data Lakes, Streaming Data (Kafka, Event Hub), Data Modeling, BigQuery, Spark, Databricks, Azure Data Factory, Airflow

Databases: MySQL, PostgreSQL, MongoDB, Snowflake, Firebase

Cloud & Tools: Azure, AWS, GCP, Git, GitHub, Power BI

Frameworks: TensorFlow, Flask, Django, Gradio

Concepts: Data Integration, Data Structures, Machine Learning, Generative AI, Deep Learning, NLP

Soft Skills: Leadership, Agile, Problem-Solving, Team Collaboration

[Update this skill section based on the job Description]

Education:

B Tech CSE (AIML) | KIT's College Of Engineering, Kolhapur | **CGPA: 8.9**

Achievements and Participations:

President | Beyond Resume 2.0 | 2024 | National level mock interview competition.

IEEE Research Paper Publication | Automated Question Generation using Pegasus.

[Add your achievements and certifications here]

Resume Tips:

1. Mirror the Job Description Keywords (Exactly)

Why it works
ATS systems score resumes by matching **exact keywords** from the job description. Synonyms often fail.

Example (Job asks for: “REST APIs, Python, SQL”)

❌ Weak

> Worked on backend services using multiple technologies.

✅ ATS-Optimized

> Built REST APIs using Python and SQL for backend services.

---

2. Customize the Resume Title for Each Job

Why it works
ATS and recruiters scan the **resume headline** first.

Example

❌ Generic

> Software Developer

✅ Targeted

> Backend Software Engineer – Python, REST APIs, SQL

---

3. Use the Exact Job Role in the Summary

Why it works
ATS gives higher relevance when the job title appears in the first 5–6 lines.

Example

❌ Generic Summary

> A motivated professional with strong technical skills.

✅ Targeted Summary

Backend Software Engineer with 3+ years of experience building REST APIs using Python and SQL in production environments.

---

4. Put Skills Section Above Experience (For Tech & Freshers)

Why it works
ATS scores skills early. Recruiters skim top half first.

Correct Order

1. Summary
2. Skills
3. Experience
4. Projects
5. Education

Example

❌ Skills at bottom

Recruiter never reaches them

✅ Skills at top

Python, SQL, REST APIs, Docker, AWS

---

5. Break Skills into Subsections (ATS Hack)

Why it works
ATS reads structured sections better than long comma lists.

Example

❌

Python, SQL, Flask, Docker, AWS, Git, Linux

✅

Programming Languages: Python, SQL
Frameworks: Flask
DevOps: Docker, AWS
Tools: Git, Linux

---

6. Use Standard Section Headings Only

Why it works
ATS is trained on **standard resume labels**.

Use These Only

- Summary
- Skills
- Experience
- Projects
- Education
- Certifications

❌ Avoid

> "What I've Done", "My Journey", "Work Story"

---

7. Quantify Everything (Even Internships)

Why it works
Numbers increase recruiter trust and ranking.

Example

❌

> Improved API performance.

✅

> Improved API response time by 35% by optimizing SQL queries.

---

8. One Bullet = One Skill (ATS Scoring Trick)

Why it works
ATS parses each bullet independently.

Example

❌

> Developed APIs and managed databases using Python and SQL.

✅

> Developed REST APIs using Python.
> Managed relational databases using SQL.

---

9. Use Action Verbs That ATS Likes

Why it works
Recruiters scan verbs quickly.

Use These

- Developed
- Implemented
- Designed
- Optimized
- Automated
- Deployed
- Analyzed
- Integrated

Example

❌

> Was responsible for deployment.

✅

> Deployed backend services using Docker on AWS.

---

10. Match Experience Bullets to Job Requirements

Why it works
Recruiters compare line-by-line with the JD.

JD Requirement: “Experience with REST APIs”

✅ Bullet

> Designed and deployed REST APIs handling 10k+ daily requests.

---

11. Avoid Tables, Columns, Graphics, Icons

Why it works
ATS often fails to parse complex layouts.

❌ Two-column Canva resume
❌ Icons for phone/email
❌ Skill bars or stars

✅ Simple single-column Word or PDF resume

---

12. Use Reverse Chronological Order

Why it works
ATS expects newest experience first.

Correct

- Software Engineer – 2023–Present
- Intern – 2022–2023

---

13. Add a “Projects” Section if Experience < 3 Years

Why it works
ATS treats projects like experience.

Example

Project: E-commerce Backend System

> Built REST APIs using Python and Flask.
> Designed SQL database schema for orders and users.

---

14. Repeat Critical Keywords Naturally (3–5 Times)

Why it works
ATS ranking improves with frequency.

Example (Python)

- Summary: Python developer
- Skills: Python
- Experience: Developed Python APIs
- Projects: Python-based system

---

15. Add Tools & Technologies Exactly as Mentioned

Why it works
ATS does not infer equivalents.

JD: PostgreSQL
❌ SQL Database
✅ PostgreSQL

---

16. Use Simple Fonts ATS Can Read

Safe Fonts

- Calibri
- Arial
- Times New Roman
- Helvetica

❌ Fancy fonts
❌ Handwritten fonts

---

17. Save Resume with Professional File Name

Why it works
Recruiters notice professionalism.

❌ resume_final_v3.pdf
❌ myresume.pdf

✅

> Atharva_Patil_Backend_Engineer_Resume.pdf

---

18. Include Location and Work Authorization

Why it works
ATS filters candidates by location and visa.

Example

> Location: Pune, India
> Work Authorization: Eligible to work in India

---

19. Remove Irrelevant Experience Ruthlessly

Why it works
ATS and recruiters penalize noise.

Example

❌

Event volunteer, school captain, sports team (for SDE role)

✅

Only technical, analytical, or role-relevant content

---

20. Tailor One Resume per Job (Not One for All)

Why it works
ATS score depends on job-to-resume similarity.

Best Practice

- Resume A → Backend Engineer
- Resume B → Data Analyst
- Resume C → ML Engineer

Each with **custom summary, skills, keywords**
